IDENTIFICATION OF MAJOR CLINICAL CHARACTERISTICS OF CHINESE SLE PATIENTS AND LINEAR CORRELATIONS AMONG SLEDAI, SF-36 AND HADS-ANXIETY USING MOBILE SMART SYSTEM OF DISEASE MANAGEMENT (SSDM)

Background and aims
The association among SLEDAI, SF-36 and HADS in China was unknown. The system SSDM is an effective mobile interface to serve for physicians with valuable data. SLEDAI was significantly correlated with SF-36 and HADS-A independently. The regression equation was

$$SLEDAI = 0.461 + 1.114 \times HADS-A$$

Methods
SSDM includes physicians' and patients' application system. All patients fulfilling the 1997 ACR criteria for SLE were enrolled.

Results
A total of 3717 SLE patients from 490 rheumatologists in 214 rheumatology centres across China participated in the study (89% were women). The mean age was 34.09 ± 11.87 years and the median disease duration was 3.15 years. 1,908 patients performed self-assessment for 3085 times. The mean score of SLEDAI, SF-36, HADS-Anxiety (HADS-A) and HADS-Depression (HADS-D) were 9.41 ± 2.52, 60.09 ± 20.01, 7.86 ± 4.09 and 8.77 ± 4.25 respectively. According to the SLEDAI criteria, 43.71%, 18.50%, 13.42% and 24.37% patients achieved Remission, Low, Moderate and High disease activity. SLEDAI was significantly correlated with SF-36 and HADS-A independently. The regression equation was “SLEDAI=21.753–0.179SF-36” (p=0.028) and “SLEDAI=0.461+1.114HADS-A” (p=0.011). SSDM is an effective mobile interface to serve for physicians and patients performing self-management as well as to supply physicians with valuable data. SLEDAI was significantly correlated with SF-36 and HADS-A independently.

EVALUATION OF ATOPY AND EOSINOPHILIA IN PATIENTS WITH PSORIASIS

Background and aims
Psoriasis is a TH1 and TH17 cells-dependent autoimmune disease of the skin and joint while allergic disorders are TH2 cell-dependent. There are conflicting reports about the effect of atopy on psoriasis. With regard to these reports, the aim of the current study was to determine the frequency of atopy, allergic disorder (such as allergic rhinitis, asthma and eczema) and eosinophilia in patients with psoriasis.

Methods
For this purpose, this case-control study was performed in Mashhad Ghaem hospital. History of allergic diseases including: allergic rhinitis, asthma and eczema were evaluated based on ISAAC standard questionire. Skin prick test was performed with 5 common aeroallen in our region and atopy was define as a result of only one positive skin test.
Abstracts

prick test. Also peripheral blood samples were obtained to determine serum levels of IgE and blood eosinophil cell count in both study groups.

Results A total of 52 patients with psoriasis, and 50 healthy subjects as the control group were considered. Between allergic diseases only asthma was lower in psoriatic patients rather than controlled by ISAC questionaire (p=0.044). There is no significant difference between result of skin prick test (atopy) in case and control group (P). Also no significant correlation was found between eosinophil count (p=0.057) and IgE level in case and control group (p=0.88).

Conclusions In general, these findings suggest that the Asthma was not common in psoriasis, and support the concept that Asthma protects against the autoimmune disease such as psoriasis.

ASSOCIATED FACTORS ON SLEEP DISORDERS IN SYSTEMIC LUPUS ERYTHEMATOSUS

Y Li, 1Xiangya hospital – Central South University, Department of Rheumatology and Immunology, Chang Sha, China

Background and aims To investigate the prevalence of sleep disorders and the relevant determinants in a cohort of SLE patients.

Methods One hundred patients with SLE were included in the study. Sleep quality was assessed using the Pittsburgh Sleep Quality Index (PSQI). Depression, anxiety, quality of life, and fatigue were evaluated by PHQ-9, GAD-7, SF-36, and VAS respectively. The demographic and clinical data were also recorded. SLE disease activity and damage severity were assessed by SLEDAI and SDI respectively.

Results The prevalence of sleep disorders in SLE patients was 42%. Compared with patients without sleep disorders, the ratio of males and married patients, age, the score of SDI, PHQ-9, GAD-7, and fatigue were higher in SLE patients with sleep disorders, while the score of SF-36 was lower (p<0.05). Age, SLEDAI, SDI, PHQ-9, GAD-7, and fatigue correlated positively with sleep disorders (p<0.05). C3 and the score of SF-36 correlated negatively with sleep disorders (p<0.05). In multiple logistic regression analyses, gender, anxiety, body pain, and energy were the independent determinants of sleep disorders (R²=0.494, P<0.01).

Conclusions Poor sleep quality is common in SLE patients. Gender, age, disease activity and severity, anxiety, depressed mood, and quality of life contribute significantly to sleep disorders in SLE.

THE LONG-TERM OUTCOMES ON LEFLUNOMIDE TREATMENT IN PATIENTS WITH LUPUS NEPHRITIS: A TWELVE-YEAR FOLLOW-UP STUDY

W Minjun, 1Y Gong, 2F Xiao*. 1Shanghai, China; 2Cinkate Corp., Medical and Marketing Department, Shanghai, China

Background and aims One phase III study has reported that Leflunomide (LEF) in combination with prednisone was effective in the induction therapy of proliferative lupus nephritis (LN). However, long-term data of LEF in the maintenance treatment of LN are lacking. The aim of this study was to investigate the long-term outcomes of LEF in the maintenance treatment of LN in an open-label extension of a prospective multi-centre observational study.

Methods 70 patients were enrolled into LEF induction group with a loading dose of 50 mg/day for 3 days, followed by 30 mg/day for six months. The partial and complete remission rate was 52% and 21%. Among them, 15 patients voluntarily entered an open labelled extension study. Data for survival and kidney function were prospectively collected during a 12 year period for the 15 patients who were maintained on 20 mg/day LEF.

Results 15 patients (mean age 40.2±7.4 years; 86.6% female) were treated with LEF for >12 months, the mean duration of LEF treatment was 11.8 years. During a median follow-up period of 12.3 years, 1 patient died from sepsis, 4 patients developed renal flare. The 12 year cumulative survival rates for the composite end point of death and chronic renal failure were 93.3% and 100%, respectively. At the final follow-up, the complete remission rate in the remaining patients was 71.43%, the partial remission rate was 28.57%, the mean proteinuria level was 0.33g/day (range 0.07–1.62 g/day), and the mean serum creatinine level was 62.3 umol/L.

Conclusions Our data suggest that a remission-inducing regimen of LEF followed by maintenance therapy with LEF resulted in good long-term patient survival and renal preservation.

A COMPARISON OF OVARIAN RESERVE IN WOMEN WITH SYSTEMIC LUPUS ERYTHEMATOSUS FOLLOWING TREATMENT WITH INTRAVENOUS CYCLOPHOSPHAMIDE VS ORAL MYCOPHENOLATE MOFETIL

P Potturi*, 1S Sharma, 2P Sikka, 3M Rathi, 4N Sachdeva, 5S Jain, 1PGIMER, Internal Medicine, Chandigarh, India; 2PGIMER, Gynaecology and Obstetrics, Chandigarh, India; 3PGIMER, Nephrology, Chandigarh, India; 4PGIMER, Endocrinology, Chandigarh, India

Introduction Immunosuppression with Cyclophosphamide is treatment of choice in lupus nephritis. Ovarian reserve depletion is well known complication. Early identification of depletion of ovarian reserve can be done by correlating antral follicle count with AMH.

Aims- To assess the ovarian reserve in patients who have received IV Cyclophosphamide vs those who have received Mycophenolate-mofetil for SLE by measuring AMH, Inhibin B, FSH and antral follicular count.

Methods A prospective Case-Control study with 50 patients who were diagnosed with SLE were studied. Twenty-five cases and controls defined by females age 18-40 with SLE were enrolled. Cases received IV CYC as per NIH protocol and controls received oral MMF. Baseline FSH, LH, E2, AMH, Inhibin B, FSH and antral follicular count were obtained at baseline and at 6 months.

Results Mean age: cases- 31.36±6.357, controls- 28.36±4.396 (p=0.058).

Conclusions MMF did not cause decrease in ovarian reserve. IV CYC caused subclinical depletion of ovarian reserve with significant decreased in AMH, Inhibin B and E2 levels and follicular counts. AMH and AFC are good markers to assess subclinical depletion of ovarian reserve.
