and placebo (3 times daily), for 3 months. Anti-ds DNA serum levels were measured by ELISA and urine protein were measured by urine albumin creatinine ratio (UACR).

**Results** After supplementation for 3 months, this study showed that decreased of anti-dsDNA serum levels in the supplementation group was significantly greater than in the placebo group. The decreased of UACR in the supplementation group was also significantly greater than the placebo group.

**Conclusions** Adding curcumin on vitamin D supplementation can decrease anti-dsDNA serum levels and proteinuria greater than vitamin D supplementation plus placebo in SLE patients with hipovitamin D.

**Background and aims** Vitamin D has important roles in the regulation of the immune system in Lupus. Seventy percent of lupus patients in Indonesia are experienced hypovitamin D. Curcumin is a natural VDR ligand and has sinergic effect with vitamin D. This study was aimed to determine the effect of adding curcumin on vitamin D supplementation on IFN-γ/IL-4 ratio and IL-17/TGF-β ratio, in SLE patients with hipovitamin D.

**Methods** This was a randomised controlled trial, double blind study. Forty SLE patients with hypovitamin D were studied, that randomised into two groups: 20 patients (supplementation group) received vitamin D (cholecalciferol 1200 IU daily) with curcumin 20 mg (three times daily); and 20 patients (placebo group) was given vitamin D (cholecalciferol 1200 IU daily) and placebo (3 times daily), for 3 months. Cytokines serum levels (IFN-γ, IL-4, IL-17, TGF-β), were measured by ELISA.

**Results** After supplementation for 3 months, this study showed that decreased of IFN-γ/IL-4 ratio in the supplementation group was significantly greater than in the placebo group. The decreased of IL-17/TGF-β ratio in the supplementation group was also significantly greater than the placebo group.

**Conclusions** Adding curcumin on vitamin D supplementation can decrease IFN-γ/IL-4 ratio and IL-17/TGF-β ratio than vitamin D supplementation plus placebo in SLE patients with hipovitamin D.

**THE EFFECT OF VITAMIN D3 SUPPLEMENTATION ON THE ANTI-DSDNA LEVELS AND URINE PROTEIN IN SLE PATIENTS WITH HYPOVITAMIN D**

1H Susianti*, 2CS Wahono, 1ST Priyantoro, 1K Handono, 1H Kalim. 1Faculty of Medicine Brawijaya University/Dr. Saiful Anwar General Hospital, Clinical Pathology, Malang, Indonesia; 2Faculty of Medicine Brawijaya University/Dr. Saiful Anwar General Hospital, Internal Medicine, Malang, Indonesia

10.1136/lupus-2017-000215.259

**Background and aims** Vitamin D has important role in the regulation of the immune system in Lupus. Seventy one percent of lupus patients in Indonesia experienced hypovitamin D. This study was aimed to determine the effect of vitamin D supplementation on the levels of anti ds DNA and degree of urine protein in lupus patients with hypovitamin D.

**Methods** Thirty nine SLE patients with hypovitamin D were studied, that randomized into two groups: 20 patients was given vitamin D and 19 patients received placebo for 3 months. Anti-ds DNA levels were measured by ELISA and urine protein were measured by dipstick method.

**Results** Anti-dsDNA levels in the supplement group before and after giving vitamin D were 226.84±82.11 vs 191±72.55 (p=0.00), and the placebo group were 233.69±66.52 vs 227.72±61.21 (p=0.077). The degree of urine protein in the supplement group before and after treatment were 24 vs 12 U/ml (p=0.003) and the placebo group were 16 vs 10 U/ml (p=0.070).

**Conclusions** Vitamin D supplementation plays a role on decreasing the levels of anti ds-DNA and urine protein in SLE patients with hypovitamin D.
