**DELETION OF THE BAFF RECEPTOR TACI FULLY PROTECTS AGAINST SLE WITHOUT REDUCTION OF B CELL NUMBERS AND FUNCTION**

F Mackay*, 1University of Melbourne, School of Biomedical Sciences, University of Melbourne, Australia

10.1136/lupus-2017-000215.345

**Background and aims** B cell-activating factor of the TNF family (BAFF) is an essential B cell survival factor. However, high levels of BAFF promote systemic lupus erythematosus (SLE) in mice and humans. Belimumab (anti-human BAFF) limits B cell survival and is approved for use in patients with SLE. Surprisingly, the efficacy of rituximab in SLE remains controversial, despite depleting B cells more potently than belimumab. This raises the question of whether B cell depletion is really the mechanism of action of belimumab. In BAFF transgenic (BAFF-Tg) mice, SLE development is T cell-independent but relies on innate activation of B cells in cooperation with the BAFF receptor TACI. Therefore, in this study we tested whether TACI, a BAFF receptor dispensable for B cell survival may have a role in the pathogenesis of SLE.

**Methods** To test the role of TACI in driving BAFF-mediated autoimmunity, we reconstituted BAFF Tg mice with a TACI-/- mice. Mouse and human DC subsets were stimulated ex vivo by human DCs was measured and the IFN-\(\lambda\) expression was measured.

**Results** We show that loss of TACI on B cells protected against BAFF-mediated autoimmune manifestations while preserving B cells, suggesting that loss of BAFF signalling through TACI, rather than loss of B cells, may underpin the effect of belimumab in the clinic. Moreover, a multimeric form of BAFF, is very effective at activating TACI, suggesting that this abnormal form of BAFF may also be a pathogenic factor in SLE.

**Conclusions** B cell-sparing blockade of TACI may offer a more specific and safer therapeutic alternative to broad B cell depletion in SLE.

**Background and aims** Interferon lambda (IFN-\(\lambda\)) is a novel type of interferon produced by dendritic cells (DC). Despite its binding to a different receptor, IFN-\(\lambda\) shares functional similarities with type I IFN (IFN-I) by upregulating the expression of IFN-stimulated genes. The role of IFN-\(\lambda\) in DC biology and in autoimmunity remains unknown.

- to identify the DC subsets producing IFN-\(\lambda\).
- to investigate the role of IFN-\(\lambda\) in DC functions.
- to investigate the role of IFN-\(\lambda\) in SLE.

**Methods** Mouse and human DC subsets were stimulated ex vivo and the IFN-\(\lambda\) expression was measured.

**Results** The maturation and the capacity of DC to cross-prime T cells was compared in WT and IFN-\(\lambda\)-/- mice. T cell cross-priming by human DCs was measured ex vivo in the presence of exogenous IFN-\(\lambda\).

- Serum levels of IFN-\(\lambda\) was measured in lupus-prone mice and in SLE patients. The phenotype of the blood DC subsets from SLE patients was also characterised.

**Conclusions** IFN-\(\lambda\) is produced by some DC subsets and enhances their functions. Furthermore, IFN-\(\lambda\) is expressed during SLE, suggesting a potential role of the cytokine in the aetiology of SLE.

**IMPACT OF CD200-FC ON DENDRITIC CELLS IN LUPUS-PRONE NZB/WF1 MICE**

W Mo*, Y Yin, X Zhang. Beijing peking union medical college hospital, rheumatology, Beijing, China

10.1136/lupus-2017-000215.347

**Background and aims** Abnormal expression of CD200/CD200R1 may contribute to the immunologic abnormalities in patients with systemic lupus erythematosus (SLE). This study aimed to assess the function of CD200/CD200R1 and impact of CD200-Fc on dendritic cells in lupus-prone NZB/WF1 mice.

**Methods** Female NZB/WF1 mice were treated with CD200-Fc or control for 4 weeks. Plasma samples were collected to measure autoantibody levels. The expression levels of CD200/CD200R1 in peripheral blood mononuclear cells (PBMCs) and splenocytes were examined.

**Results** The percentage of CD200/CD200R1-positive cells in splenocytes from NZB/WF1 mice was lower than that of C57BL/6 mice (p<0.05). The plasma level of anti-dsDNA was significantly higher in NZB/WF1 mice than C57BL/6 mice (p<0.001). However, the anti-dsDNA levels decreased (p=0.047) after CD200-Fc treatment. Finally, CD200-Fc reduced the levels of IL-6 (p=0.017) and IL-10 (p=0.03) in the dendritic cell culture supernatant.

**Conclusions** The immunosuppressive CD200/CD200R1 signaling pathway might be involved in the immunopathology of NZB/WF1 mice; the present results merit further exploration of agents that can modulate the CD200/CD200R1 pathway as a therapy for human lupus.
