**Results** Tregs from SLE patients showed a significantly reduced number, elevated apoptosis rates and impaired suppressive capacity compared with NCs. The increased Tregs apoptosis was negatively correlated with the total number of Tregs and positively correlated with disease activities. Microarray profiles of Tregs from SLE subjects reveal a cellular response that could make cells sensitive to apoptosis, partially due to the stress responses, DNA-damaging and cytokine stimulation.

**Conclusions** This global picture of pathway-specific expression signatures is a step further dissecting Treg cells defects in the pathogenesis of SLE, and may shed light on the newly therapeutic strategies towards the aberrant Treg apoptosis and reconstruction of SLE immune homeostasis.

**52 THE PATHOGENIC RELEVANCE OF T FOLLICULAR HELPER CELLS-PLASMABLASTS AXIS IN PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS**

S Nakayamada*, S Kubo, M Yoshikawa, Y Miyazaki, K Sakata, K Nakano, S Ivata, I Miyagawa, K Saito, Y Tanaka. University of Occupational and Environmental Health, First Department of Internal Medicine, Kitakyushu, Japan

Background and aims The aim of this study was to assess the peripheral immune cell phenotypes in a correlation with clinical findings in patients with systemic lupus erythematosus (SLE).

Methods Peripheral blood mononuclear cells were obtained from 143 SLE patients and 26 healthy donors (HD). Circulating B, T and dendritic cells were defined based on flow cytometric analysis for human immune system termed “the Human Immunology Project” proposed by the National Institutes of Health (NIH) and the Federation of Clinical Immunology Societies (FOCIS).

Results The proportions of CD3+CD4+CXCR5+ICOS+ T follicular helper (Tfh) cells, but not CD3+CD4+CXCR3+CCL6-Th1 and CD3+CD4+CXCR3+CCL6-Th17 cells, were higher in SLE than the HD. The proportions of CD19+CD20+IgD−CD27+ central memory B cells and CD19+CD20+IgD+CD27+ central memory B cells and Th1 and CD3+CD4+CXCR3+CCL6-Th17 cells were higher in SLE and correlated with BILAG index. The largest difference relative to the HD was observed in the proportion of CD19+CD20+CD27+CD38+ plasmablasts, which was higher in SLE and correlated with BILAG index. The proportion of Tfh cells correlated with serum IgG level, and the proportion of activated Tfh cells correlated with serum anti-Sm antibody level. Among helper T cell subsets (Th1, Th17, Treg and Tfh), Tfh cells only showed positive correlation with the proportion of plasmablast (r=0.24, p=0.02).

Conclusions Peripheral immuno-phenotyping confirmed the importance of Thf-plasmablasts axis in patients with SLE, i.e. activation of Tfh cells correlated with autoantibody production while plasmablast did with disease activity of SLE. Our findings supported the relevance of Tfh-plasmablasts axis as a potential therapeutic target for SLE.

**53 REPOSITORY CORTICOTROPIN INJECTION EXERTS DIRECT ACUTE EFFECTS ON HUMAN B CELL GENE EXPRESSION DISTINCT FROM THE ACTIONS OF GLUCOCORTICOIDS**

1. Olsen*, 1A Benko, 1C McAlouse, 2T Sunyer, 3P Becker, 1W Kovacs. 1Penn State Hershey Medicine, Hershey, USA; 2Mallinckrodt Pharmaceuticals, Clinical Translational Research, Hazelwood Missouri, USA

Background and aims Repository corticotropin injection (RCI; H.P. Acthar Gel) is a porcine pituitary-derived ACTH preparation approved by the FDA for therapy in selected cases of SLE. Previous studies have shown that RCI directly inhibits human B cell function in vitro. We used RNA-Seq to identify elements of the transcriptome that are acutely modulated by RCI in human B cells activated in vitro by IL4 and CD40 ligand. We compared RCI effects to those of a synthetic glucocorticoid (dexamethasone; Dex) under the same conditions.

Results 115 unique gene transcripts were significantly and reproducibly upregulated by RCI after 24 hours in culture. Pathways analysis revealed that upregulated genes were over-represented in “immune system response” (2.8-fold; p=0.026) and “response to stress” (4.16-fold; p=0.0069). 74 gene transcripts were down-regulated by RCI, and these were over-represented in two pathways: “immune system response” (2.91-fold; p=0.035) and “cellular process” (1.73-fold; p=0.0036). In Dex-treated cells, 65 gene transcripts were upregulated and 23 gene transcripts were down-regulated. There was no overlap between the sets of genes upregulated by RCI and Dex.

Conclusions These data suggest that RCI exerts direct effects on human B cells to acutely modulate gene expression. These effects are distinct from those of glucocorticoids, supporting potential differences in mechanism of action of these two agents for treatment of autoimmune diseases.

**54 ROS2 AUTOANTIBODIES ARISE FROM SELF-REACTIVE PROGENITORS IN A MOTHER OF A CHILD WITH NEONATAL LUPUS**

1J Reed*, 1M Gorny, 1J Whybark, 1T Cardozo, 1J Buyon, 1A Clancy, 1Garvan Institute of Medical Research, Immunology, Darlinghurst, Australia; 2New York University School of Medicine, Pathology, New York, USA; 3New York University School of Medicine, Pharmacology, New York, USA; 4New York University School of Medicine, Medicine, New York, USA

Background and aims Autoantibodies targeting Ro52 occur in systemic lupus erythematosus, Sjogren’s syndrome and idio-pathic inflammatory myopathies. Yet the most compelling evidence for their pathogenesis is the development of cardiac conduction abnormalities, a manifestation of neonatal lupus, in...
foetuses exposed to maternal anti-Ro52 autoantibodies. Recent studies investigating other pathogenic autoantibodies (anti-interferon, anti-desmoglein) report that they arise as a result of somatic mutation. The aim of this study was to determine how anti-Ro52 autoantibodies originate.

Methods We traced the evolution of two anti-Ro52 autoantibodies isolated from circulating IgG-switched memory B-cells from a mother of two children with cardiac neonatal lupus. Each antibody was expressed as its immune form or pre-immune ancestor by reverting somatic mutations to germline sequence. Antibody reactivity against autoantigens Ro52, Ro60, La and dsDNA were tested by ELISA.

Results Both anti-Ro52 autoantibodies utilised the same heavy and light chain genes (IGHV3-23 and IGLV1-44) but represented distinct clones based on differing complementarity determining region sequences. Anti-Ro52 autoantibodies exhibited a low frequency (3%-4%) of somatic mutations compared to the average rate of 8% in healthy switched memory B-cells. In contrast to other pathogenic autoantibodies, the pre-immune (germlined) anti-Ro52 autoantibodies showed specific binding to Ro52. However, Ro52 reactivity was higher for the mutated post-immune antibodies compared to their pre-immune counterparts demonstrating that auto-reactivity was enhanced by affinity maturation.

Conclusions These data demonstrate that Ro52 reactivity is an intrinsic property of the germline antibody repertoire in a mother of children affected by neonatal lupus and indicate defects in central and peripheral tolerance pathways allowing propagation of pathogenic autoantibodies.

Methods TLR-dependent and T dependent B cell differentiation to plasma cells (PC) was induced with LPS and with TLR-dependent and T dependent B cell differentiation and activation and alters autoimmune parameters in the chronic graft versus host disease (cGVHD) model of lupus.

Results RGC-32 KO B cells failed to differentiate normally to CD4 T cells. We used wild-type (WT) and RGC-32 knockout (KO) mice to determine whether lack of RGC-32 impairs B cell differentiation and activation and alters autoimmunity parameters in the chronic graft versus host disease (cGVHD) model of lupus.

Methods TLR-dependent and T dependent B cell differentiation to plasma cells (PC) was induced with LPS and with CD40mAb plus IL-4. cGVHD was induced with 100x10⁶ Bm12 splenocytes injected into WT or RGC-32 KO recipients.

Results RGC-32 KO B cells failed to differentiate normally to PC as demonstrated by a 2-fold reduction in PC numbers generated after stimulation and impaired upregulation of Prdm1 and IRF4 mRNA. RGC-32 transcripts were upregulated in spleen cells from cGVHD mice and protein expression was detected in B cells and germinal centre (GC) cells. RGC-32 KO hosts displayed an attenuated autoimmune phenotype as demonstrated by decreased production of anti-dsDNA autoantibodies and proliferation of germinal centre B cells. In addition a decreased number of IgG anti-dsDNA secreting PC and IRF4 and Prdm1 mRNA expression were found.

Conclusions These results suggest that expression of RGC-32 in B cells is critical for optimal GC proliferation, PC differentiation and autoantibody production in a murine model of lupus. These data support the idea that RGC-32 blockade has the potential to attenuate autoimmune parameters of cGVHD and possibly reverse abnormalities in the T and B cell that contribute to lupus pathogenesis.
