LUPUS EXERCISE AND PERSONAL MEDICATION RECORD ON MOBILE APPLICATION TO HELP IMPROVE THE QUALITY OF LIFE OF PEOPLE WITH LUPUS

D Syarief, Bandung, Indonesia

10.1136/lupus-2017-000215.149

Background and aims Syamsi Dhuha (Morning Light) Foundation (SDF) has identified two major challenges among the lupus patients who are members of SDF:

- Those who have joint pain and muscle stiffness find it difficult to do their daily activities.
- Those who have to consult two or more doctors/physicians are having difficulties to combine and maintain their medical records in one place.

The above challenges brought us to the current works as solutions to the problems:

- To create "Lupus Exercise" (LE)
- To create "Lupus Diary Mobile Application" (LD App).

Methods SDF worked together with the Faculty of Sports Education and Health, Education University of Indonesia in developing LE. This LE is recorded and uploaded into YouTube, making it possible for lupus patients to follow the exercise.

SDF worked together with the School of Pharmacy at University of Surabaya, in developing the content for personal medication records. The App is available in Indonesia, English and Mandarin languages, and can be installed on android smartphones.

Results LE is a set of exercise suitable for people living with Lupus, as it:

- Can ease joint pain and stiffness if done regularly.
- Can promote better general health conditions.

LD App is a personal medication record application for smartphone users, intended to help lupus patients:

- Record their personal medication history.
- Remind them to take medication and scheduled therapy.
- Save images of lab test results.

Conclusions Both LE and LD App is expected to help people with lupus in coping with Lupus and in helping improve their quality of life.

SLE Complications and comorbidities

150 LOW PLASMA CONCENTRATIONS OF APOLIPROTEIN M CORRELATE TO DISEASE ACTIVITY AND ENDOTHELIAL DYSFUNCTION IN SLE

AA Bengtsson, Tydén, C Jönsen, B Gallstrand, D Dahlbäck. Lund University, Clinical Sciences Lund - Rheumatology, Lund, Sweden; Lund University, Laboratory Medicine Malmö - Clinical Chemistry, Malmö, Sweden

Background and aims ApoM is an antiatherogenic and vasculoprotective 25 kDa apolipoprotein suggested to play a role in keeping endothelial barrier integrity. The aims of the current study were to determine the impact of SLE disease activity on apoM levels and investigate if apoM levels reflect endothelial function in SLE.

Methods Plasma concentrations of apoM were measured with ELISA in two SLE cohorts, all patients fulfilling ≥4 American College of Rheumatology (ACR) classification criteria for SLE, and 100 healthy controls (HC). Patients in cohort I had active disease as evaluated with SLEDAI scores. In cohort II endothelial function was measured by EndoPAT 2000 and correlated to apoM levels. A low Reactive Hyperemia Index (RHI) value indicates endothelial dysfunction.

Results In cohort I, the plasma levels of apoM were found to be significantly decreased in SLE (p<0.0001), and the apoM concentrations correlated inversely to disease activity (SLEDAI, r=−0.29, p=0.0063). ApoM was also significantly lower in patients with active nephritis, leukopenia, anti-DNA antibodies or rash compared to patients without these manifestations.

In cohort II, using linear regression analysis, there was a positive correlation between apoM levels and the RHI value, indicating endothelial dysfunction, in the younger SLE patients: β=0.94 CI 95% 0.22,1.65 r=0.32 p=0.011.

Conclusions SLE related inflammation may have an impact on lower plasma apoM, which may affect the endothelium and the process towards cardiovascular disease.
